Ex IIC

(Q2h)
$$\int (\cos x - \sec x)^{2} dx = \int (\cos^{2}x - 2\cos x \sec x + \sec^{2}x) dx$$

$$= \int (\cos^{2}x - 2 + \sec^{2}x) dx$$

$$= \int (\frac{1}{2} + \frac{1}{2}\cos^{2}x - 2 + \sec^{2}x) dx$$

$$= \frac{1}{2}x + \frac{1}{4}\sin^{2}x - 2x + \tan x + C$$

$$= \frac{1}{4}\sin^{2}x + \tan x - \frac{3}{2}x + C$$

IID)
$$\int_{0}^{1} kx^{2}e^{x^{3}} dx = \frac{2}{3}(e^{8} - 1)$$

$$\int_{0}^{1} kx^{2}e^{x^{2}} = \left[\frac{k}{3}\right]e^{x^{3}} dx = \frac{k}{3}e^{x^{2}} - \frac{k}{3}$$

$$= \frac{k}{3}(e^{4x^{3}} - 1)$$

$$8 = 6^{3}$$

$$2 = 6$$

$\sin^n x \cos x$ vs $\sec^n x \tan x$

Notice when we differentiate $\sin^5 x$, then power decreases:

$$\frac{d}{dx}(\sin^5 x) = 5 \sin^4 x \cos x$$

$$(\sin^5 x)^5$$

However, when we differentiate $\sec^5 x$:

$$\frac{d}{dx}((\sec x)^5) = 5\sec^4x \sec x \tan x$$

$$= 5\sec^5x \tan x$$

Notice that the power of sec didn't go down. Keep this in mind when integrating.

$$\int \sin^4 x \cos x \, dx = \frac{1}{5} \sin^5 x + C$$

$$\int \sec^4 x \tan x \, dx = \frac{1}{4} \sec^4 x + C$$

$$\frac{1}{4} \times 4 \sec^3 x \times \sec(x \tan x)$$

$$\int \cos x \sin^2 x \, dx = \frac{1}{3} \sin^3 x + C$$

$$\int \sec^3 x \tan x \, dx = \frac{1}{3} \sec^3 x + C$$

Your Turn

$$\int \sin x (\cos x + 1)^5 dx$$

$$\int \frac{\cos c^2 x}{(2 + \cot x)^3} dx$$

$$\int \cos x (2 + \cot x)^{-3} dx$$

$$\int \frac{\cos x}{(2 + \cot x)^3} dx$$

$$\int \frac{\cos x}{(2 + \cot x)^3$$

$$\int \frac{\sec^2 2x}{\tan 2x + 1} dx$$

$$\int x(x^2 + 2)^3 dx$$

$$consider: \ln | tan 2x + 1|$$

scale: 5 = \frac{5}{2} \tan^2 x + C

SKILL #5: Integration by Substitution

For some integrations involving a complicated expression, we can make a substitution to turn it into an equivalent integration that is simpler. We wouldn't be able to use 'reverse chain rule' on the following:

Use the substitution u = 2x + 5 to find $\int x\sqrt{2x+5} \ dx$

The aim is to completely remove any reference to x, and replace it with u. We'll have to work out x and dx so that we can replace them. u=2x+5

STEP 1: Using substitution, work out x and dx (or variant)

$$\int x \sqrt{2x+5} \, dx \qquad u = 2x+5$$

$$\sqrt{u} \qquad \frac{u-5}{2} = x$$

 $\int x\sqrt{2x+5} dx = \int \frac{u-5}{2} \times u^{1/2} \times \frac{1}{2} du$

$$\frac{du}{dx} = 2$$

$$\frac{du}{dx} = dx$$

$$\frac{1}{2}du = dx$$

STEP 2: Substitute these into expression.

STEP 3: Integrate simplified expression.

STEP 4: Write answer in terms of x.

$$2x+5 dx = \int \frac{u-5}{2} \times u^{1/2} \times \frac{1}{2} du$$

$$= \int \frac{(u-5)u^{1/2}}{4} du$$

$$= \frac{1}{4} \int (u-5)u^{1/2} du$$
Tip: If you have a constant factor, factor it out of the integral.
$$= \frac{1}{4} \int (u^{3/2} - 5u^{1/2}) du$$

$$= \frac{1}{4} \int (u^{3/2} - 5u^{1/2}) du$$

$$= \frac{1}{4} \left(\frac{1}{5} u^{5/2} - \frac{10}{3} u^{3/2}\right) + C$$

$$= \frac{1}{4} \left(\frac{1}{5} u^{5/2} - \frac{10}{6} u^{3/2} + C\right) = \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2} - \frac{1}{6} u^{3/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

$$= \frac{1}{10} \left(\frac{1}{2} x + \frac{1}{3} u^{5/2}\right) + C$$

Using substitutions involving implicit differentiation

When a root is involved, it can make things tidier if we use $u^2 = \cdots$

Use the substitution $u^2 = 2x + 5$ to find $\int x\sqrt{2x + 5} \ dx$

STEP 1: Using substitution, work out x and dx (or variant)

STEP 2: Substitute these into expression.

$$\int x \sqrt{2x+5} \, dx = \int \frac{1}{2} (u^2 - 5) u \times u \, du$$

$$= \frac{1}{2} \int (u^2 - 5) u^2 \, du$$

$$= \frac{1}{2} \int (u^4 - 5u^2) \, du$$

$$= \frac{1}{2} \int (u^4 - 5u^2) \, du$$

$$= \frac{1}{2} \int (u^5 - \frac{5}{3}u^3) + C$$

$$= \frac{1}{10} u^5 - \frac{5}{6} u^3 + C$$

$$= \frac{1}{10} (2x+5)^{5/2} - \frac{5}{6} (2x+5)^{3/2} + C$$

STEP 4: Write answer in terms of *x*.

simplified expression.

STEP 3: Integrate

This was marginally less tedious than when we used u = 2x + 5, as we didn't have fractional powers to deal with.

How can we tell what substitution to use?

In Edexcel you will *usually* be given the substitution! However in some other exam boards, and in STEP, you often aren't. There's no hard and fast rule, but it's often helpful to replace to replace expressions inside roots, powers or the denominator of a fraction.

$\cos x \sqrt{1 + \sin x} \, dx$

$$\int \frac{xe^x}{1+x} dx$$

$$\int e^{\frac{1-x}{1+x}} dx$$

Sensible substitution:

$$u = 1 + sin \pi$$

$$u = 1 + \sin \alpha$$

$$\begin{cases} \text{Exile} \\ \text{Q la} \\ \text{Q 3 ab} \end{cases}$$

$$u = 1 + 3C$$

$$u = \frac{1-2c}{1+2c}$$
 (very messy)
